  - Mixed Use

The hazard data shown on the map was created from an indicative 1 in 100 year flood depth grid. The PPS25 maps should be viewed before, or in conjunction with, these indicative hazard maps. The Flood Zones shown on the PPS25 maps take precedence over the hazard zones shown on these maps as the hazard information is, as stated, derived from indicative depths. Indicative hazard data is only shown on these maps where depth data is available.

The depth grid was obtained from the Environment Agency North East Broad Scale modelling work for CFMPs undertaken by JBA Consulting in 2008. The methodology for the North East Broad Scale Modelling is based on the original methodology used in creating the original Environment Agency Flood Map using the overland routing model JFLOW. However, the map was improved by updating the hydrology of inflows into the model, and updating the topographical data from NextMap to LIDAR data. Flow paths under structures were also included to provide a more realistic result. Whilst the extent of the hazard data cannot be directly compared to the current Flood Zones in North West Yorkshire, they do provide a useful indication of potential scale of flood hazard during a 1 in 100 year event.
